The Patent Office
Concept House
Cardiff Road
Newport
South Wales
NP10 8QQ

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

I also certify that the attached copy of the request for grant of a Patent (Form 1/77) bears a correction, effected by this office, following a request by the applicant and agreed to by the Comptroller-General.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication of communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the patent Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been received

a) Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.
- b) Write your answers in capital letters using black ink or you may type them.
- c) If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form
If you have answered "Yes" Patents Form 7/77 will need to be filed.
- d) Once you have filled in the form you must remember to sign and date it.
- e) For details of the fee and ways to pay please contact the Patent Office.

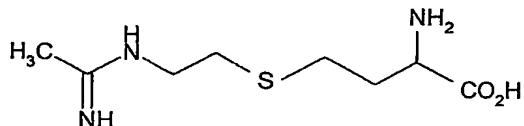

FORMULATION

The present invention relates to novel pharmaceutical formulations of (2S)-2-amino-4-[(2-(ethanimidoylamino)ethyl]thio]butanoic acid, to processes for their manufacture, and to their use in therapy.

Nitric oxide is the endogenous stimulator of the soluble guanylate cyclase enzyme and is involved in a number of biological actions. Excess nitric oxide production is also thought to be involved in a number of conditions, including septic shock and many inflammatory diseases. The biochemical synthesis of nitric oxide from L-arginine is catalysed by the enzyme NO synthase. Many inhibitors of NO synthase have been described and proposed for therapeutic use.

More recently, it has been an object in this field to provide NO synthase inhibitors displaying selectivity for either inducible NO synthase (iNOS) or neuronal NO synthase (nNOS) over endothelial NO synthase (eNOS).

Thus WO98/30537 describes selective NO synthase inhibitors of formula

or a salt, solvate, or physiologically functional derivative thereof.

Co-pending patent application application number PCT.GB.01/05596 describes a phosphate salt of (2S)-2-amino-4-[(2-(ethanimidoylamino)ethyl]thio]butanoic acid, and solvates thereof, which has advantageous properties, in particular, being considerably less hygroscopic than, for example, the hydrochloride salts exemplified in WO98/30537.

We have found that (2S)-2-amino-4-[(2-(ethanimidoylamino)ethyl]thio]butanoic acid, for example, in the form of its compound with phosphoric acid, exhibits incompatibility with standard pharmaceutical excipients conventionally used in the preparation of solid oral dosage form such as tablets. This incompatibility results in increased degradation of the (2S)-2-amino-4-[(2-(ethanimidoylamino)ethyl]thio]butanoic acid and reduced stability of the formulations. We have further found that these problems can be overcome by

the addition to solid oral dosage forms comprising (2S)-2-amino-4-{{[2-(ethanimidoylamino)ethyl]thio}butanoic acid and conventional pharmaceutical excipients of an antioxidant and/or a chelating agent.

According to the present invention there is provided a pharmaceutical composition comprising (2S)-2-amino-4-{{[2-(ethanimidoylamino)ethyl]thio}butanoic acid, a pharmaceutically acceptable bulking agent and one or more antioxidants or chelating agents.

For use in accordance with the present invention, the (2S)-2-amino-4-{{[2-(ethanimidoylamino)ethyl]thio}butanoic acid will preferably be in the form of its compound with phosphoric acid, preferably in hydrated form. More preferably each molecule (2S)-2-amino-4-{{[2-(ethanimidoylamino)ethyl]thio}butanoic acid is associated with at least one molecule of water, such as 1, 2 or 3 water molecules, especially 1 or 3 water molecules. Suitably, the (2S)-2-amino-4-{{[2-(ethanimidoylamino)ethyl]thio}butanoic acid comprises from about 0.1 to about 5 % by weight, preferably about 0.25 to about 2.5%, more preferably about 0.5 to about 1%, such as about 0.6%, based on the dry weight of the dosage form.

It will be appreciated by those skilled in the art that phosphoric acid exists in more than one form. The preferred form for use in the context of the present invention is orthophosphoric acid.

Pharmaceutically acceptable bulking agents are inert substances that provide bulk and dilute the active ingredient when used in the compositions of the present invention. Suitable pharmaceutically acceptable bulking agents will be well known to the person skilled in the art and a non-limiting list of examples includes microcrystalline cellulose (available as, for example, AvicelTM), croscarmellose sodium, crospovidone, starch, calcium carboxymethylcellulose, silicified microcrystalline cellulose, magnesium oxide, tragacanth, dibasic calcium phosphate dihydrate, anhydrous dibasic calcium phosphate (available as, for example, EmcompressTM), tribasic calcium phosphate, calcium carbonate, magnesium carbonate, calcium sulfate, cellulose acetate, powdered cellulose, kaolin, polymethacrylates and talc. The pharmaceutically acceptable bulking agents may be used alone or in combination with each other. Preferred is AvicelTM, such as, for example, AvicelTM PH101, AvicelTM PH102, AvicelTM PH112, AvicelTM PH113 and AvicelTM PH200, starch, and mixtures thereof. Suitably, the pharmaceutically acceptable bulking agents comprises from about 80 to about 99.5 % by weight, preferably about 90 to about 99 %, more

preferably about 95 to about 98.3 %, based on the dry weight of the dosage form.

Suitable antioxidants and chelating agents for use in the compositions of the present invention include, for example, organic acids such as

5 ethylenediaminetetraacetic acid (EDTA), ascorbic acid, malic acid, citric acid and fumaric acid, and salts and esters thereof such as, for example, sodium ascorbate and propyl gallate, salts of inorganic acids such as, for example, sodium metabisulfite, alcohols such as, for example, maltol and alpha tocopherol and aromatic compounds such as, for example, butylated

10 hydroxyanisole and butylated hydroxytoluene. Preferred are EDTA, malic acid and ascorbic acid and mixtures thereof. Suitably, the antioxidant, chelating agent, or mixture thereof comprises from about 0.005 to about 5 % by weight, preferably about 0.01 to about 2.5%, more preferably about 0.05 to about 2%, such as about 0.1%, based on the dry weight of the dosage form.

15 Thus, in a further embodiment of the present invention, there is provided a pharmaceutical composition as hereinbefore described wherein the 2(S)-2-amino-4-[[2-(ethanimidoylamino)ethyl]thio]butanoic acid comprises from about 0.1 to about 5% by weight, preferably about 0.25 to about 2.5%, more preferably about 0.5 to 1%, especially about 0.6%, the pharmaceutically acceptable bulking agent comprises from about 80 to about 99.5% by weight, preferably about 90 to about 99%, more preferably about 95 to about 98.3%, and the antioxidant, chelating agent, or mixture thereof comprises from about 0.005 to about 5% by weight, preferably about 0.01 to about 2.5%, more preferably about 0.05 to about 2%, especially about 0.1%, based on the dry weight of the dosage form.

25 In a further embodiment of the present invention, there is provided a pharmaceutical composition as hereinbefore described wherein the (2S)-2-amino-4-[[2-(ethanimidoylamino)ethyl]thio]butanoic acid is in the form of its compound with phosphoric acid, preferably in hydrated form, more preferably in as the monohydrate or the trihydrate, the pharmaceutically acceptable bulking agent comprises AvicelTM, preferably AvicelTM PH101, AvicelTM PH102, AvicelTM PH112, AvicelTM PH113 or AvicelTM PH200, or starch, or, more preferably, a mixture of AvicelTM and starch, the antioxidant, chelating agent, or mixture thereof comprises EDTA, malic acid or ascorbic acid, or a mixture of EDTA and malic acid or a mixture of EDTA and ascorbic acid.

In addition to the ingredients described above, the pharmaceutical composition of the present invention may further comprise pharmaceutically acceptable excipients such as binding agents (e.g. pregelatinised starch, polyvinylpyrrolidone, hydroxypropylmethylcellulose) and lubricants (e.g. stearic acid, silicon dioxide, magnesium stearate, talc, sodium benzoate and hydrogenated vegetable oil).

Many drug substances have an inherently bitter taste. The unpleasant taste that is sometimes associated with oral administration of a composition comprising (2S)-2-amino-4-{[2-(ethanimidoylamino)ethyl]thio}butanoic acid may be substantially eliminated by the use of a film coat on the solid core. The solid core comprises 2S)-2-amino-4-{[2-(ethanimidoylamino)ethyl]thio}butanoic acid.

Accordingly, in one embodiment, the present invention provides a pharmaceutical composition as hereinbefore described in the form of a tablet which is film-coated.

The film coating may suitably comprise a polymer. Suitable polymers will be well known to the person skilled in the art and a non-limiting list of examples includes cellulose ethers, for example, hydroxypropylmethyl cellulose, hydroxypropyl cellulose or methylcellulose, and copolymers of methacrylic acid and methyl methacrylate.

The total film coating solids are generally applied to the solid dosage form, for example the tablet core, in an amount of from about 0.5 to 10 % by weight, preferably about 1 to about 4 %, more preferably about 2 to about 3 %, based on the dry weight of the dosage form.

The film coating may additionally comprise any pharmaceutically acceptable colourants or opacifiers including water soluble dyes, aluminium lakes of water soluble dyes and inorganic pigments such as titanium dioxide and iron oxide.

The film coating may also contain one or more plasticising agents conventionally used in polymeric film coatings, for examples, polyethylene glycol, propylene glycol, dibutyl sebacate, mineral oil, sesame oil, diethyl phthalate and triacetin. Proprietary film coating materials, such as Opaspray and Opadry, obtainable from Colorcon Ltd., UK, may be used.

The taste of oral compositions may also be improved by the use of flavouring and/or sweetening agents. Suitable flavouring agents will be well known to the person skilled in the art and a non-limiting list of examples includes lemon, orange, grapefruit, vanilla, caramel, butterscotch, hazelnut or mint flavouring. Suitable sweetening agents for use in the compositions of the invention will be well known to the person skilled in the art and a non-limiting list of examples includes sucrose, saccharin, cyclamic acid and alkali or alkali earth metal salts thereof, mannitol, acesulfame-K, stevioside, thaumatin and aspartame. The flavouring and/or sweetening agents may be used alone or in combination with each other.

As mentioned above, the compound of formula (I) is an inhibitor of NO synthase.

In a further aspect, the present invention provides a pharmaceutical composition for oral administration as hereinbefore described for use in the treatment of clinical conditions for which an inhibitor of NO synthase is indicated, in particular an inhibitor of iNOS. Such conditions include inflammatory conditions, shock states, immune disorders, disorders of gastrointestinal motility and diseases of the central nervous system including migraine and metabolic disorders including dyslipidemia.

By shock states is meant those resulting from overproduction of NO, such as septic shock, haemorrhagic shock, traumatic shock, or shock caused by fulminant hepatic failure or by therapy with cytokines such as TNF, IL-1 and IL-2 or therapy with cytokine-inducing agents, for example 5,6-dimethylxanthenone acetic acid.

Examples of inflammatory conditions and immune disorders include those of the joint; particularly arthritis (e.g. rheumatoid arthritis, osteoarthritis, prosthetic joint failure), or the gastrointestinal tract (e.g. ulcerative colitis, Crohn's disease, and other inflammatory bowel diseases, gastritis and mucosal inflammation resulting from infection, the enteropathy provoked by non-steroidal anti-inflammatory drugs), of the airways (e.g. adult respiratory distress syndrome, asthma, cystic fibrosis, upper respiratory tract inflammatory disease (e.g. rhinitis such as allergic rhinitis) or chronic obstructive pulmonary disease), of the heart (e.g. myocarditis), of nervous tissue (e.g. multiple sclerosis), of the pancreas (e.g. diabetes melitus and complications thereof), of the kidney (e.g. glomerulonephritis), of the skin (e.g. dermatitis, psoriasis, eczema, urticaria), of

the eye (e.g. glaucoma) as well as of transplanted organs (e.g. rejection) and multi-organ diseases (e.g. systemic lupus erythematosus) and inflammatory sequelae of viral or bacterial infections.

Furthermore, there is evidence for overproduction of NO by iNOS in
5 atherosclerosis and following hypoxic or ischaemic insults (with or without reperfusion), for example in the brain or in ischaemic heart disease.

Disorders of gastrointestinal motility include ileus, for example post-operative ileus and ileus during sepsis.

By diseases of the central nervous system is meant those for which overproduction of NO is implicated, for example migraine, psychosis, anxiety, schizophrenia, sleep disorders, cerebral ischaemia, CNS trauma, epilepsy, multiple sclerosis, AIDS dementia, chronic neurodegenerative disease (e.g. Lewy Body Dementia, Huntington's disease, Parkinson's disease, or Alzheimer's disease) and acute and chronic pain, and conditions in which non-adrenergic 15 non-cholinergic nerve may be implicated such as priapism, obesity and hyperphagia.

Examples of acute pain include musculoskeletal pain, post operative pain and surgical pain. Examples of chronic pain include chronic inflammatory pain (e.g. rheumatoid arthritis and osteoarthritis), neuropathic pain (e.g. post 20 herpetic neuralgia; diabetic neuropathies associated with diabetes, trigeminal neuralgia, pain associated with functional bowel disorders, e.g. irritable bowel syndrome, non cardiac chest pain and sympathetically maintained pain) and pain associated with cancer and fibromyalgia.

Overproduction of NO is implicated in metabolic disorders through its effect on lipoprotein lipase activity causing hypertriglyceridemia. Selective inhibitors of iNOS will be useful in metabolic conditions where NO over-production is implicated, such as dyslipidaemia.

Furthermore, inhibition of NO synthase may be of advantage in preventing the lymphocyte loss associated with HIV infection, in increasing the 30 radiosensitivity of tumours during radiotherapy and in reducing tumour growth, tumour progression, angiogenesis, and metastasis.

It will be appreciated that reference to treatment is intended to include prophylaxis as well as the alleviation of established symptoms.

Accordingly, the present invention provides a method for the treatment of a clinical condition in a mammal, such as a human, for which an inhibitor of nitric oxide synthase, for example, an iNOS inhibitor is indicated, which comprises oral administration of a pharmaceutical composition as hereinbefore described. In particular, the present invention provides a method for the treatment of an inflammatory and/or immune disorder, such as arthritis, allergic rhinitis or asthma. In a further preferred aspect the present invention provides a method for the prophylaxis or treatment of a clinical condition selected from pain, migraine, ileus and irritable bowel syndrome.

According to a further aspect of the invention, there is provided the use of a pharmaceutical composition for oral administration as hereinbefore described in the manufacture of a medicament for treating conditions for which an inhibitor of nitric oxide synthase, for example, an iNOS inhibitor is indicated. In particular, the present invention provides the use of a pharmaceutical composition for oral administration as hereinbefore described in the manufacture of a medicament for treating an inflammatory and/or immune disorder, such as arthritis, allergic rhinitis or asthma, pain, migraine, ileus or irritable bowel syndrome.

In the alternative, there is also provided a pharmaceutical composition for oral administration as hereinbefore described for use in medical therapy, particularly for use in the prophylaxis or treatment of a clinical condition in a mammal, such as a human, for which an inhibitor of nitric oxide synthase, for example an iNOS inhibitor, is indicated. In particular, there is provided a pharmaceutical composition for oral administration as hereinbefore described for the treatment of an inflammatory and/or immune disorder, such as arthritis, allergic rhinitis or asthma, pain, migraine, ileus or irritable bowel syndrome.

The amount of (2S)-2-amino-4-{{2-(ethanimidoylamino)ethyl}thio}butanoic acid which is required to achieve a therapeutic effect will, of course, vary with the route of administration, the subject under treatment, and the particular disorder or disease being treated. Typically a dose of from 0.001 to 200mg/kg per day, preferably 0.01 to 20mg/kg per day may be employed. The dose range for adult humans is generally from 0.1mg to 10g/day and preferably 1mg to 1g/day.

For the preparation of compositions according to the invention, the active ingredient, the antioxidant and/or chelating agent and optional additional excipients such as lubricants, etc. may be blended with the pharmaceutically acceptable bulking agent. If desired, one or more of the components of this powder blend may be granulated. Tablets may be prepared, for example, by compression of the powder blend. Capsules may be prepared, for example, by filling of the powder blend into suitable capsule shells.

The solid dosage form may be film-coated using a suspension comprising a suitable polymer in a suitable solvent. The preferred solvent for the film coating components is purified water but various classes of organic solvents commonly used in this art such as alcohols, ketones, ethers and chlorinated hydrocarbons, for example ethanol, acetone, dichloromethane and the like, may also be used. The solvent does not appear in the final product.

Herein, the term "active ingredient" means (2S)-2-amino-4-{[2-(ethanimidoylamino)ethyl]thio}butanoic acid and pharmaceutically acceptable salts and solvates thereof.

The invention is illustrated by the following non-limiting examples wherein Compound A is (2S)-2-amino-4-{[2-(ethanimidoylamino)ethyl]thio}butanoic acid, compound with phosphoric acid, monohydrate.

Example 1

Direct Compression Formulation for (2S)-2-amino-4-{[2-(ethanimidoylamino)ethyl]thio} butanoic acid, compound with phosphoric acid, monohydrate (Compound A)

Formula 1

Component	Percent w/w
Compound A	0.62
EDTA	0.1
Avicel PH101	98.28

Silicon Dioxide	0.5
Magnesium Stearate	0.5
Total Tablet Weight	250mg

Dry Granulation Method

The components other than magnesium stearate are weighed from bulk containers, sieved using either hand held screens or a Ytron-Quadro Comil 5 197AS and deposited into a stainless-steel blending container. The components are blended for up to 30 minutes using a suitable blender, such as an Apex MPX, Fordertechnik FT or Glatt GPCG. The magnesium stearate is then added to the mixture and blending is continued for approximately 2 minutes. The lubricated blend is then compressed using a suitable rotary tablet press, such as a Unipress B/D. The tablets are coated using a film coater such 10 as an Accelacota 10 or Glatt GC500.

Wet Granulation Method

The Compound A and EDTA are dissolved in a volume of water (approx. 2.5 to 3.0 litres) and sprayed onto bulk excipient particles (i.e. Avicel), granulated and 15 dried using a mixer granulator, such as a PMA10. The dry granules are blended using a suitable blender, such as an Apex MPX or Fordertechnik FT with further Avicel, silicon dioxide and magnesium stearate. The lubricated blend is then compressed using a suitable rotary press, typically a Unipress B/D press. The tablets are coated using a film coater such as an Accelacota 10 or Glatt 20 GC500.

Formulations according to the following examples were similarly prepared:

Example 2

Component	Percent w/w
Compound A	0.62
Ascorbic acid	0.1

The application of which this description and claims forms part may be used as a basis for priority in respect of any subsequent application. The claims of such subsequent application may be directed to any novel feature or combination of features described herein. This may take the form of product, composition, process or use claims and may include, by way of example and without limitation, one or more of the following claims:

10

15

20

25

30

35

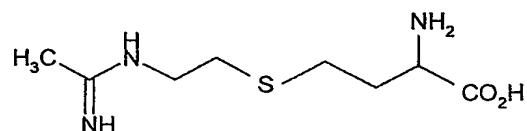

Claims

1. A pharmaceutical composition comprising (2S)-2-amino-4-{{2-(ethanimidoylamino)ethyl}thio} butanoic acid, a pharmaceutically acceptable bulking agent and one or more antioxidants or chelating agents.
2. A pharmaceutical composition as claimed in claim 1 wherein the (2S)-2-amino-4-{{2-(ethanimidoylamino)ethyl}thio}butanoic acid is in the form of its (1:1) compound with phosphoric acid, or a solvate thereof.
3. A pharmaceutical composition as claimed in claim 1 or claim 2 wherein the solvate is a hydrate.
4. A pharmaceutical composition as claimed in claim 3 wherein the hydrate is the monohydrate.
5. A pharmaceutical composition as claimed in claim 3 wherein the hydrate is the trihydrate.
6. A pharmaceutical composition as claimed in any of claims 1 to 5 wherein the 2(S)-2-amino-4-{{2-(ethanimidoylamino)ethyl}thio}butanoic acid comprises from about 0.1 to about 5% by weight, the pharmaceutically acceptable bulking agent comprises from about 80 to about 99.5% by weight, and the antioxidant, chelating agent, or mixture thereof comprises from about 0.005 to about 5% by weight, based on the dry weight.
7. A method for the treatment of a clinical condition in a mammal, such as a human, for which an inhibitor of nitric oxide synthase is indicated, which comprises administration of a pharmaceutical composition as claimed in any of claims 1 to 6.
8. A method according to claim 7 wherein the clinical condition is selected from arthritis, asthma, rhinitis, ileus, migraine, pain and irritable bowel syndrome.

-
9. A pharmaceutical composition as claimed in any of claims 1 to 6 for use in medical therapy.
- 5 10. Use of a pharmaceutical composition as claimed in any of claims 1 to 6 in the manufacture of a medicament for the prophylaxis or treatment of a clinical condition for which an inhibitor of nitric oxide synthase is indicated.
- 10 11. Use according to claim 11 wherein the clinical condition is selected from arthritis, asthma, rhinitis, ileus, migraine, pain and irritable bowel syndrome.

ABSTRACT**NITRIC OXIDE SYNTHASE INHIBITOR FORMULATION**

- 5 Pharmaceutical compositions comprising (2S)-2-amino-4-[(2-(ethanimidoylamino)ethyl]thio} butanoic acid:

- 10 a pharmaceutically acceptable bulking agent and one or more antioxidants or chelating agents are described.
